

6-6-2025

Working with a partner all day, whether human or not is tiring. You really keep on going and the pace is fast, practically coding at the speed of thought or somewhat slower. An aching back and body are the least of my concerns. It is truly hard to balance the days work which has been much more productive in some senses but also a bit jarring in terms of my overall flow and day. It really feels like everything has changed. And you can get sucked into code projects for days. So while you are building ~~as~~ a new garden you still have to tend the weeds take out the trash and do the routine. What it's like working with the machine. The back and forth the commits, the branches. The waiting and watching and learning. The AI is an incredibly creative as software engineer. Much in the same way we would put together tools, reduce problems, try different angles and approaches. And the surprising additional things it picks up or decides to check. And then there is real time creativity maybe it is mastery. To fully know all languages of all utilities. And how might this design differ if it were sorted and reimplemented from the bottom up in Python and what then would be the best way to know which libraries to use if any and are there tools for that abstraction as well. Right now is the time to rate limit out in the areas that are exciting. Both in terms of free services and paid which tie directly into the foundational models. And if done well like we are seeing with agent editors the tying together of a tool and giving it "agency" and the responsibility to execute on your behalf and you are likewise responsible for what it creates and ensuring

the changes contain nothing unsavoury and there is a lot of trust put into something that I could easily fashion a malicious script of ill repute or something to simply wreak havoc like random deletion of system files. There is much to think about but I have found it most joyous to play and be creative and leave the teaching to others for a bit, while I can show right now learning, use and production are key, there is, is there? A perfect tool for a more frequently interrupted sometimes distracted lifestyle. The Lomax 4 mode has been incredible to work with. Using OpenAI 4.1 to create mock up images towards product features, to be and like magic it is off writing code, watching my actions in the terminal where every now and again I ctrl-c the program and it then begins crunching away on the problem anew, either a code change or many or maybe a test to better determine either a solution or how to reproduce a problem in a simpler setting. Good things of such complexity as a flutter app are able to be worked on so beautifully and also conveniently fast to develop with hot reload and I haven't even gotten into debugging on that platform which will become important. While not laws there are a lot of things to learn while vibing but fortunately you can start and learn as you go.
