

1-1825 There is a show on Henry Danger and they are talking about rights. Strange to think about the philosophers who pondered government and my love in college, for that book from Rousseau about man out of nature and Mumford's culture of cities. But other animals and insects build communities and cities they have as much in common with us as we have our great differences with all other animals but still this difference makes us curious perhaps forever restless and wondering for why things happened like this. Would ever had dawned on some of our early founding fathers to play with promouns. Likely yes is my guess. There really is little that is new given the many people - the many years.

But somewhere something was lost during our evolution some piece seems to have been changed or modified. No way this is nature. Nature does not have exceptions like this or does. Let's assume the opposite of this position. Nature does create one-offs and we are the outcome of that. Somehow our evolution made our minds different than other creatures. But although the same hardware it seems the software was re-written. Or some piece was unlogged. But even through changing DNA or analysis of the body nothing could be done.

can detect or know what makes us humans
the way we are. With our sounds and language
and emotions and tools and views of time
developing both past and present and introducing
reflection, perception, consciousness and the
ability to wonder, build, create, make hypothesis,
anything to remove ourselves from the present moment.
Perhaps that was the apple from the garden of
eden fable. But still, how does an animal
come out of the state of the present moment?
Given all, the species and gears it doesn't
seem to happen by chance, choice and also
isn't something we've figured out how to pass
on or engineer. Even the machinations of nature
could not bring this change and it vexes me
where it came from. For sure I don't believe
the human recollection but the stories and
history point to something and yet the members
of our species who existed before we say
time and technology could reject - or archeology
or toolmaking. But also what if - but that
thought I don't know what, the what if is, right
what if we also had whatever changed our species
through time there was, reset by nature trying
to re-establish their violent order and the
seeming chaos of planetary changes and space
reactions in our chemical universe. But
as a species we have persevered. Ourselves,
other animals, extinction and also the planet
itself possibly resetting the clock and geologic

notes of our history. So let's say we are
the non-animal. The different and blended sup-
erlat is if what technology or change could
have made us this way. Nothing makes
sense and there is evidence of things being
lost and repeated and the records at the
edge of our timekeeping of our leftover
archeology and technology of our art
and creation can only go so far back.
Going back 10-15000 years may be too much
and a complete eraser of all culture. Does
that mean the shift was recent. Unless
like other things there have also been cycles
this change. Given our knowledge of the planetary
record, quite a few changes have already happened.
And how far we explain much which is so
long back and far away. It may have taken
5000 years after the last ice age for us to
to get back to remembering that reset and
what had happened. Hard to say when
the change happened or how and how long
that seed took to sprout change and evolve.
Was it sudden? Our little golden is such a sweetie
and good company she is very loving and mild mannered.
That's about all it takes to get me writing these days
sometimes writing is easier than anything else I want
to do. It's like my video game and sometimes I can
tell my current wants to go out rather I can take
in and this is an easy and adequately one. Fanciful
writing is like string compared to the snowshoeing type

experience of say keeping a day log. It is a true midway operation. Constantly churning over and plowing new ground or old ground. Seeing what themes emerge and what might find its way into my page. As much as this is my stream of consciousness it is also imbued with my creativity and my being is influenced by environment. But why this particular fascination of man out of nature. And the timing of history in general and sense that something is amiss. There is no way this is all natural or makes any sense.

Kids are kids not too different from each other and just like we all once were. And sometimes what we eat or watch or how we are creates some of the energies and behaviors in us. Why is there any question? What was the question? Who was asking what? Where were we now? Let's start from the beginning. How wrong are we when we talk about the beginning of civilization? And when do we consider civilization to have begun. Sometime before hunter gatherers. Are other animals civilized? What does that word even mean. Something beyond family. Is tribal still within nature. Nature also has its own characters and oddities and perversions. That is not unique to humans or civilizations. Perhaps that is why we can see ourselves so easily in other animals - our natural counterparts. But why are we seemingly somehow different and set free. I could wrack my mind for a lifetime seeking some answers to this question and why I don't know but it has always interested me and been part of my

interest in the philosophical and in the mystical.
Ah the mystical, the beautiful, the all everything
super galactical. Rocket Rocker Man! He rocks his
chair and can travel to the moon. And when on
the moon, he collects green cheese. This cheese
is highly prized in Paris, New York and
Quebec. It is soft and spongy and comes from
moonspores which are said to give you longevity.
People live to about 150 and talk of being able
to increase that having moon cheese that can
be more easily mined or grown on earth although
no successful attempts have succeeded yet
and thus it is still a very lucrative trade.
